

a Triangulation solvers

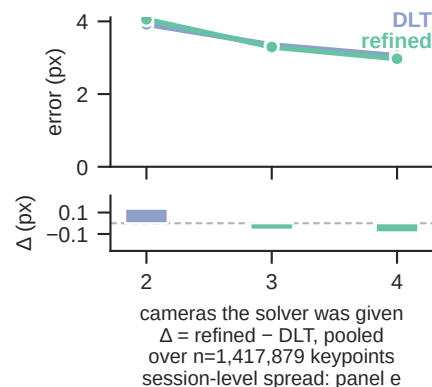

b Accuracy vs cameras used

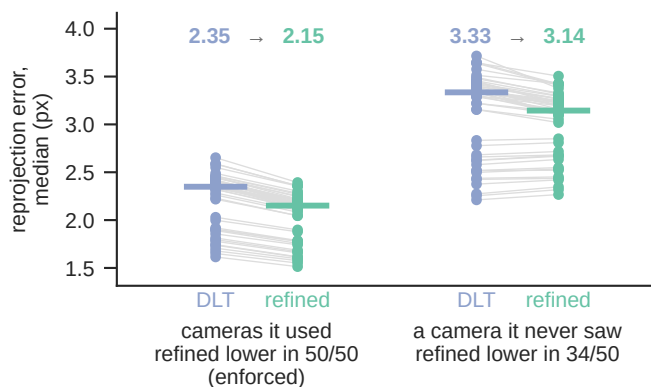

c Dropping the worst camera

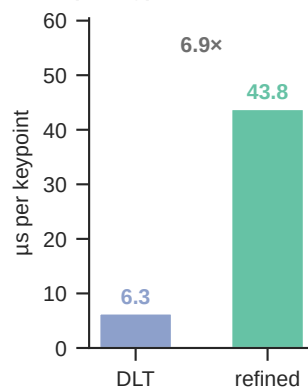

d Error in an unused camera

e Per session, both solvers

f Time per keypoint

All panels: the same 50 BMimica sessions, 5 cameras, 3 calibrations. c-f 4,253,636 keypoints at stride 60; b 1,277,424 at stride 200.

b is the Fig 2 measurement: DLT only, brought into this pipeline's frame by RANSAC-Procrustes, so its floor is a comparison floor, not accuracy.

Median lens-distortion displacement 8.42 px (p95 23.36). See caption for what is enforced rather than observed.
